EduPro | Executive summary

For education and government stakeholders | Evidence window: 1 January–30 December 2025

Purpose. Describe who enrolls and what courses they select, using the supplied workbook. This is not an evaluation of learning outcomes, program impact or population-level access.

Headline indicator	Finding
Participation baseline	3,000 registered learners; all have at least one transaction
Recorded enrollment	10,000 transactions across 60 courses
Largest age segment	26–35: 47.99% of enrollment; 48.20% of learners
Highest enrollment rate	Under 18: 3.39 enrollments per learner
Gender distribution	Female: 50.78% of enrollment; Male: 49.22%
Top category	Data Science: 916 enrollments (9.16%)
Enrollment intensity	Mean 3.33; median 1; 54% have one enrollment
Concentration	Top 300 learners account for 42.34% of enrollment

What the evidence suggests

Demand is broad rather than dominated by one subject: category shares range from 8.06% to 9.16%. Gender-based category-share gaps are all below one percentage point. Most of the age-volume difference reflects the number of learners in each band, while per-learner enrollment rates are similar.

Beginner courses lead narrowly (35.73%), followed by Advanced (34.75%). Free courses account for 64.03% of enrollment, but also 63.33% of the catalog. Course availability should be considered before attributing these totals to learner preference. “Beginner” is a course label, not a verified learner skill.

Recommended decisions

• Prioritize a review of Data Science capacity and feedback without removing other subjects on modest rank differences.
• Investigate whether one-enrollment learners achieved their goals before treating them as disengaged.
• Review course-level metadata and the unusual activity-count distribution.
• Add optional learning goals, prior experience, accessibility and completion measures before evaluating learner success.
• Report reach, intensity and outcomes separately; use measured pilots rather than demographic assumptions.

Evidence cautions

Ages are restricted to 15–35, and only Female/Male gender labels appear. The source’s representativeness is unknown. A transaction does not prove attendance, completion or skill attainment. No causal or statistical-significance claim is made. One source labels Advanced Python as Beginner. No learners have five to eight enrollments; provenance should be checked.

Delivery. The accompanying executed notebook, aggregate workbook, research paper and interactive Streamlit source make the analysis reproducible. The dashboard must be launched locally or deployed; it is not a hosted live service.
